AWS Network Manager

AWS Network Manager

Network Manager enables you to centrally manage your AWS Cloud WAN core network and your AWS Transit Gateway network across AWS accounts, Regions, and on-premises locations. With multi-account support you can create a single global network for any of your AWS accounts, and register transit gateways from multiple accounts to the global network using the Network Manager console. In this workshop, you will learn how you can use AWS Network Manager to visulaize, manage and troubleshoot your global network build using TGW.

Observing and Diagnosing your Network on AWS > AWS Network Manager > Lab 1 - Create and visualize the Global Network

Lab 1 - Create and visualize the Global Network

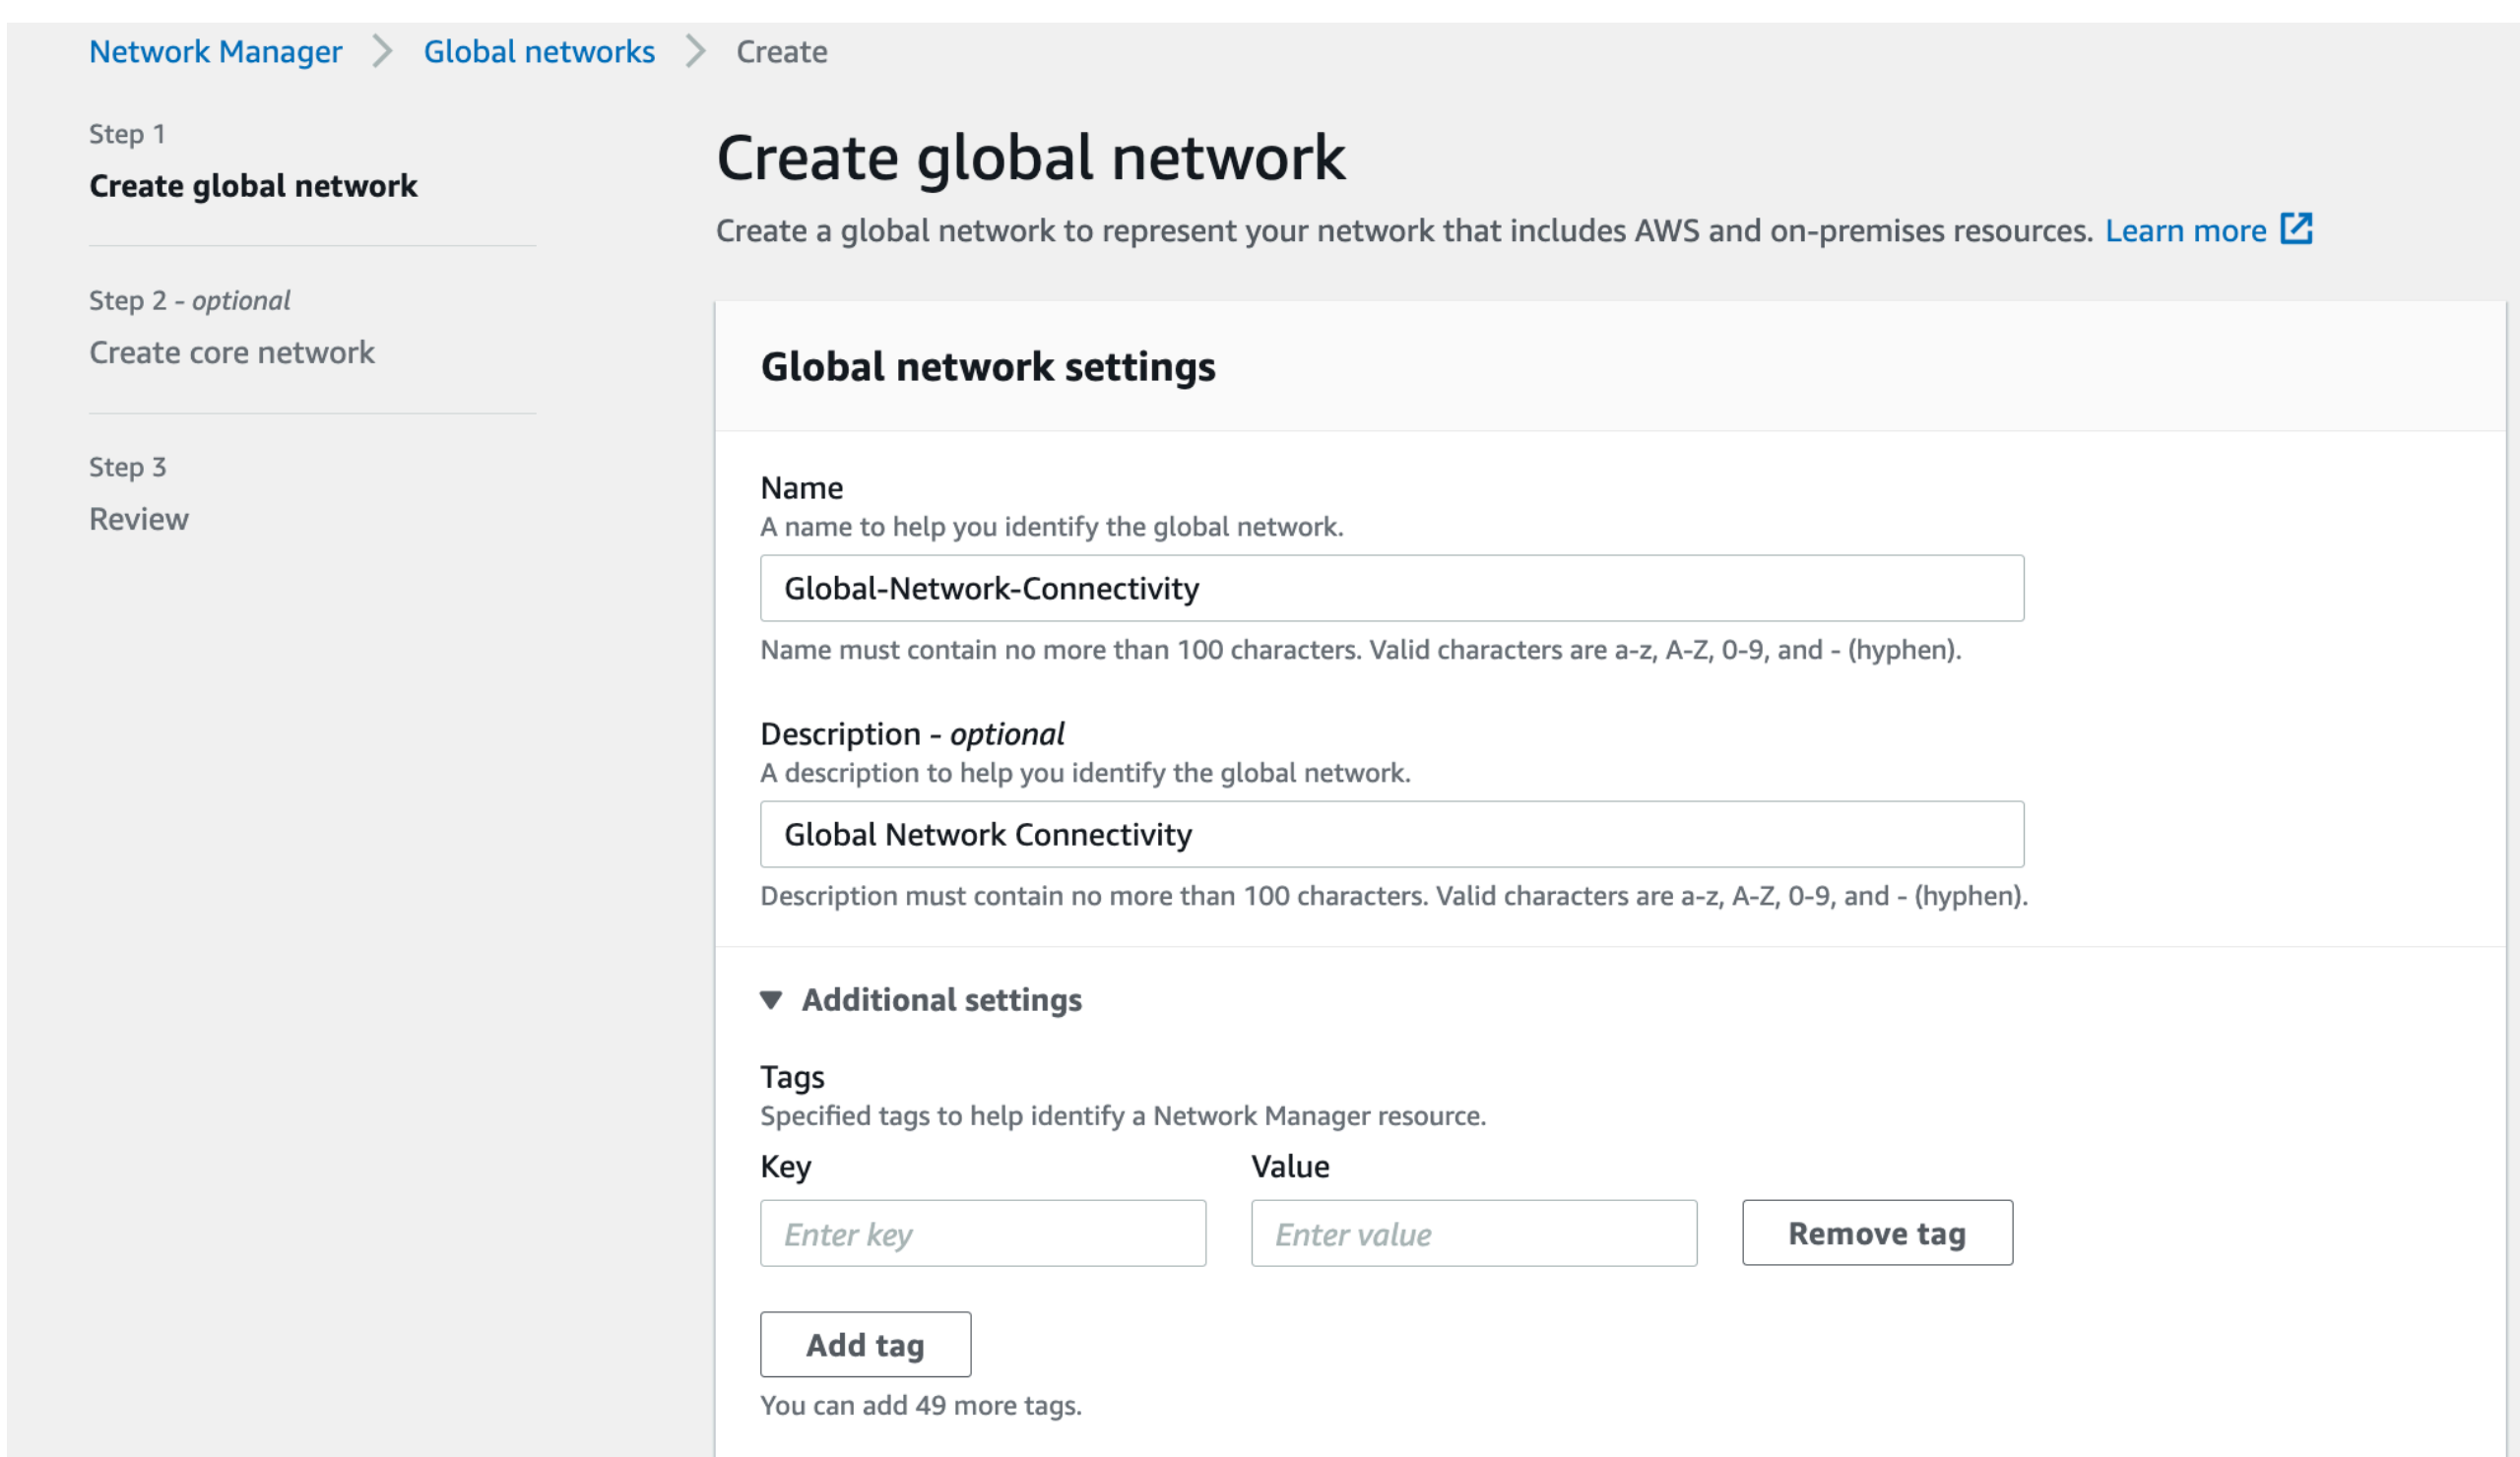

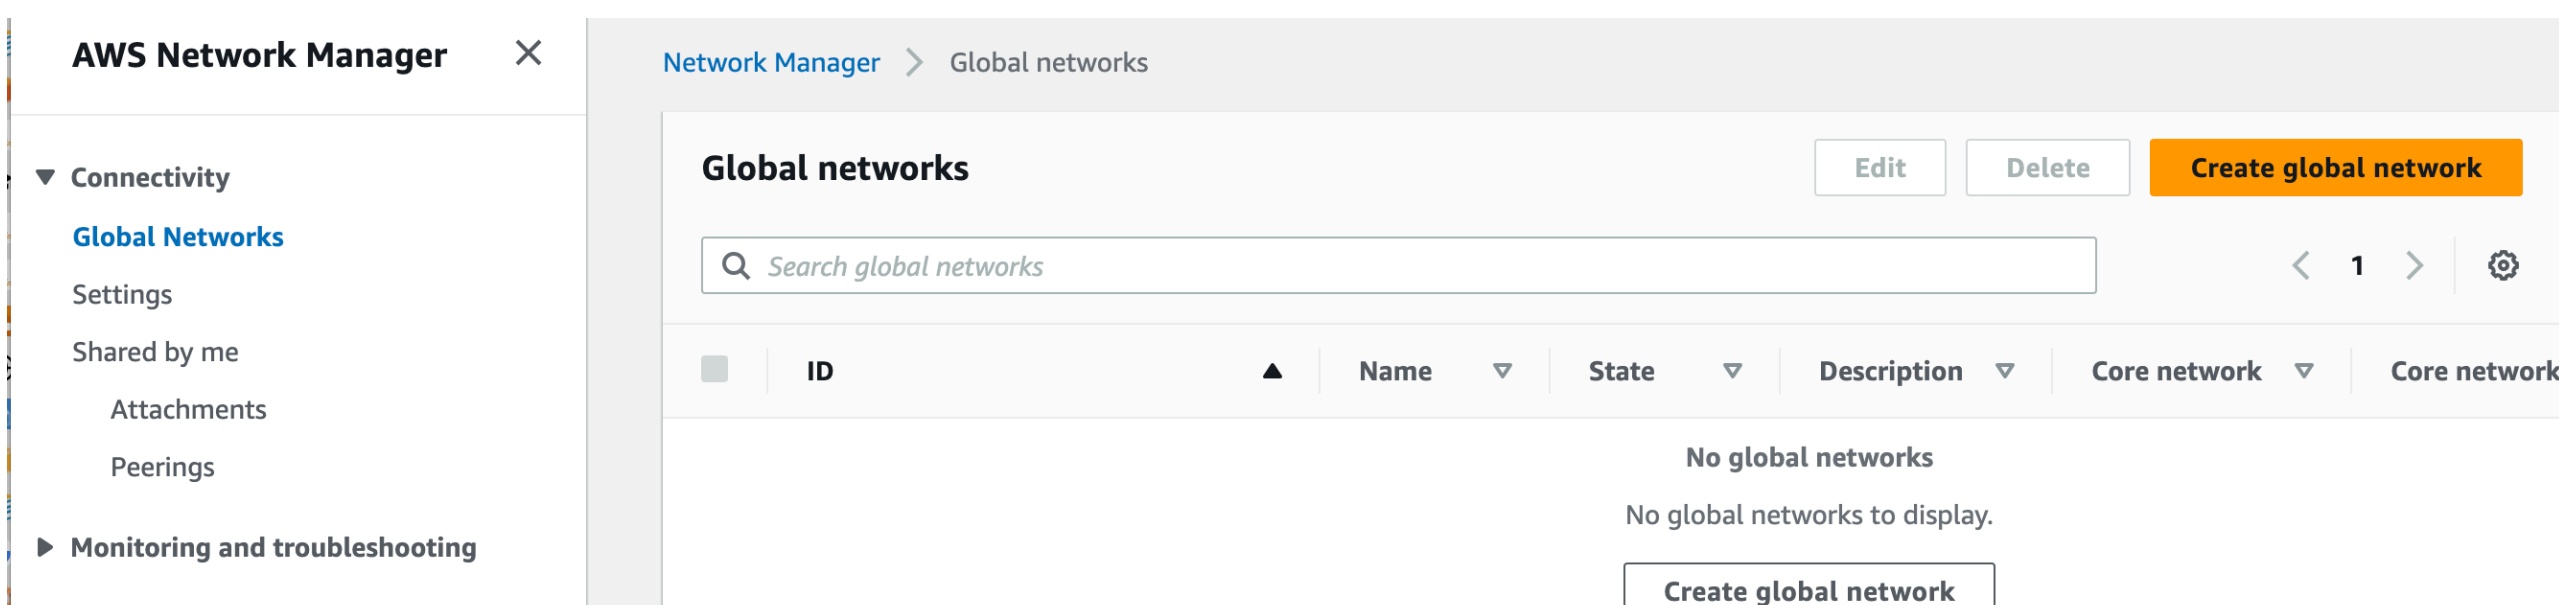

Objective: In this section of the workshop we will use AWS Network Manager to visualize how VPCs are attached to Transit Gateway. This can be further extended to visualize other TGW attachments like Connect, Direct Connect and Peering attachments.

Enable AWS Network Manager

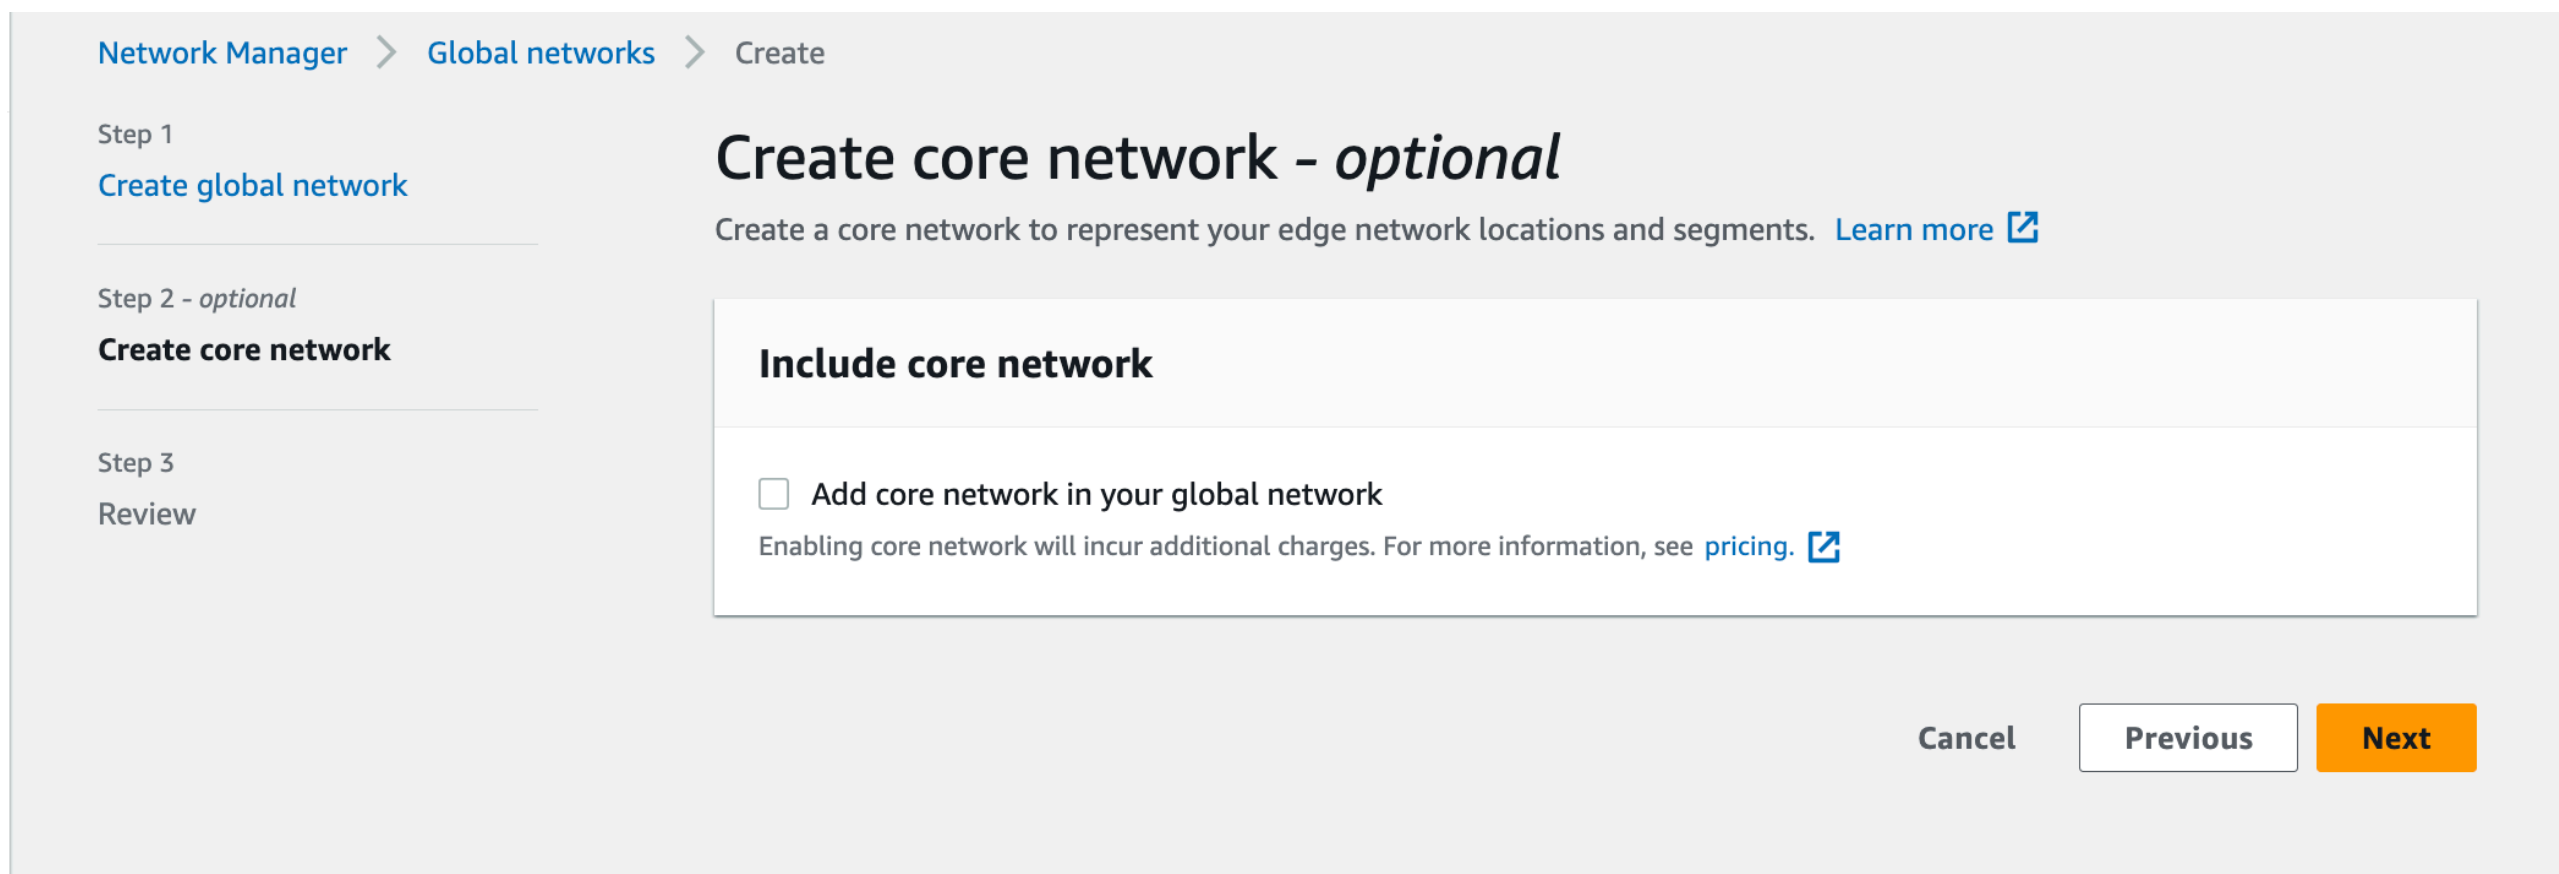

1. From the **AWS Console** click in the search bar in the top left corner. Type **VPC** in the services search bar. Select **VPC** from the list.

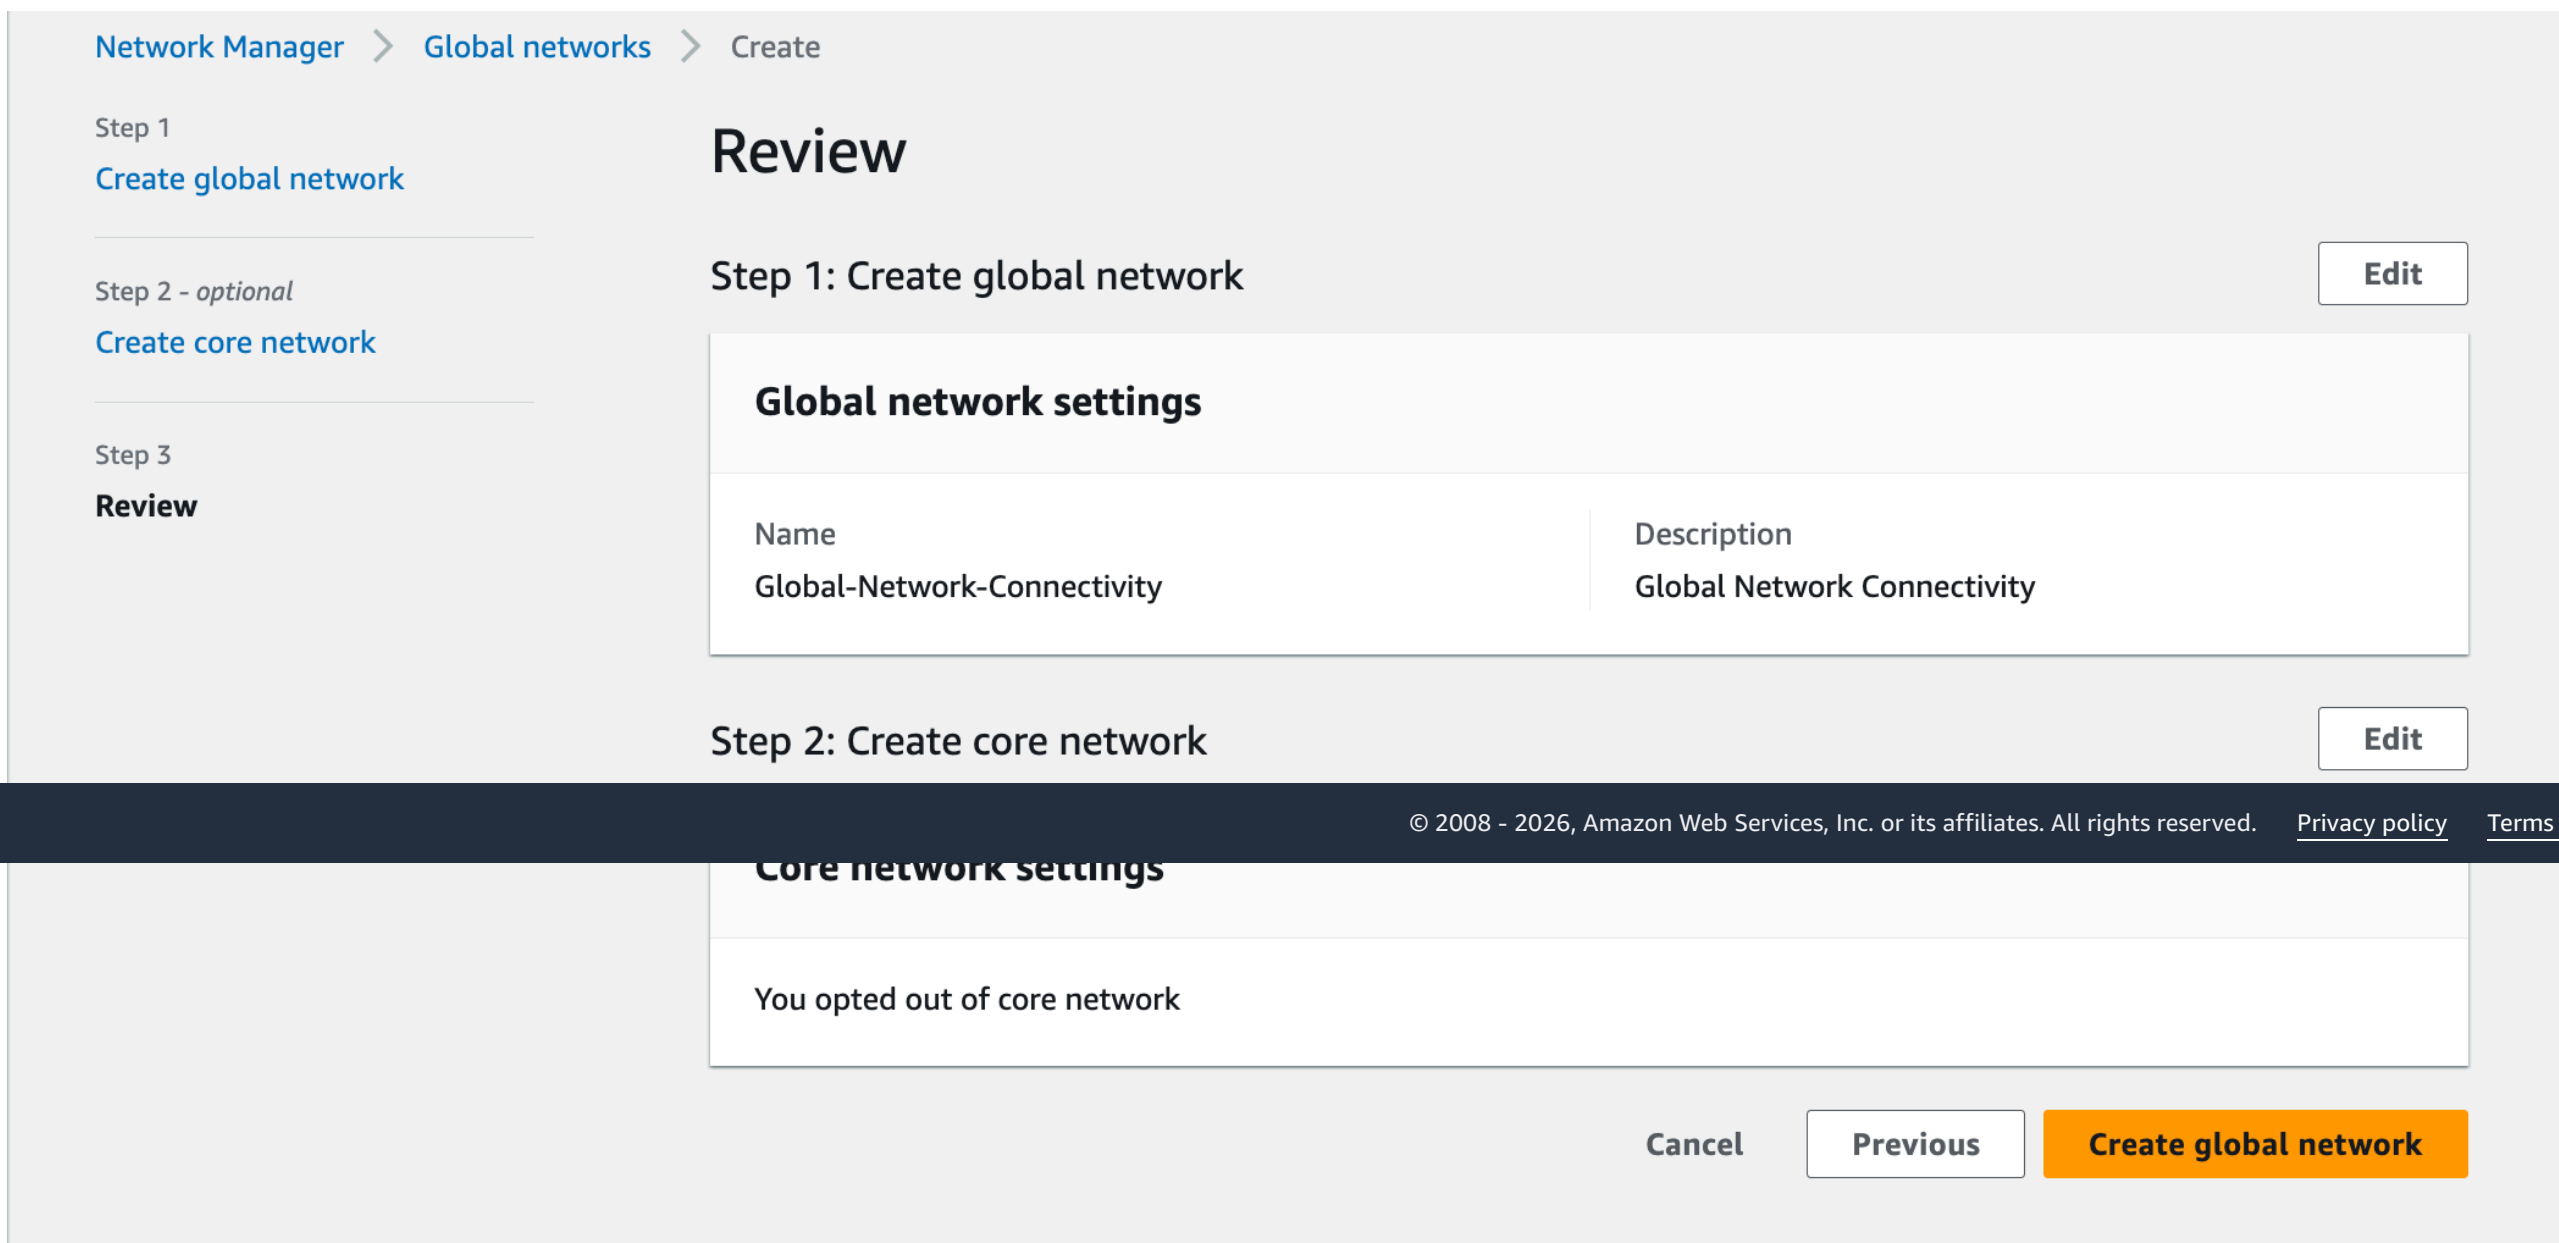

2. Scroll on the left pane and Click **Network Manager** on the left side of the screen. A new browser tab will open up. Click on **Global Network** which can be found under the **Connectivity** on the left pane and then click **Create Global Network**. Provide the Name and Description of your choice and click on **Next**. Please refer to the below screenshots.

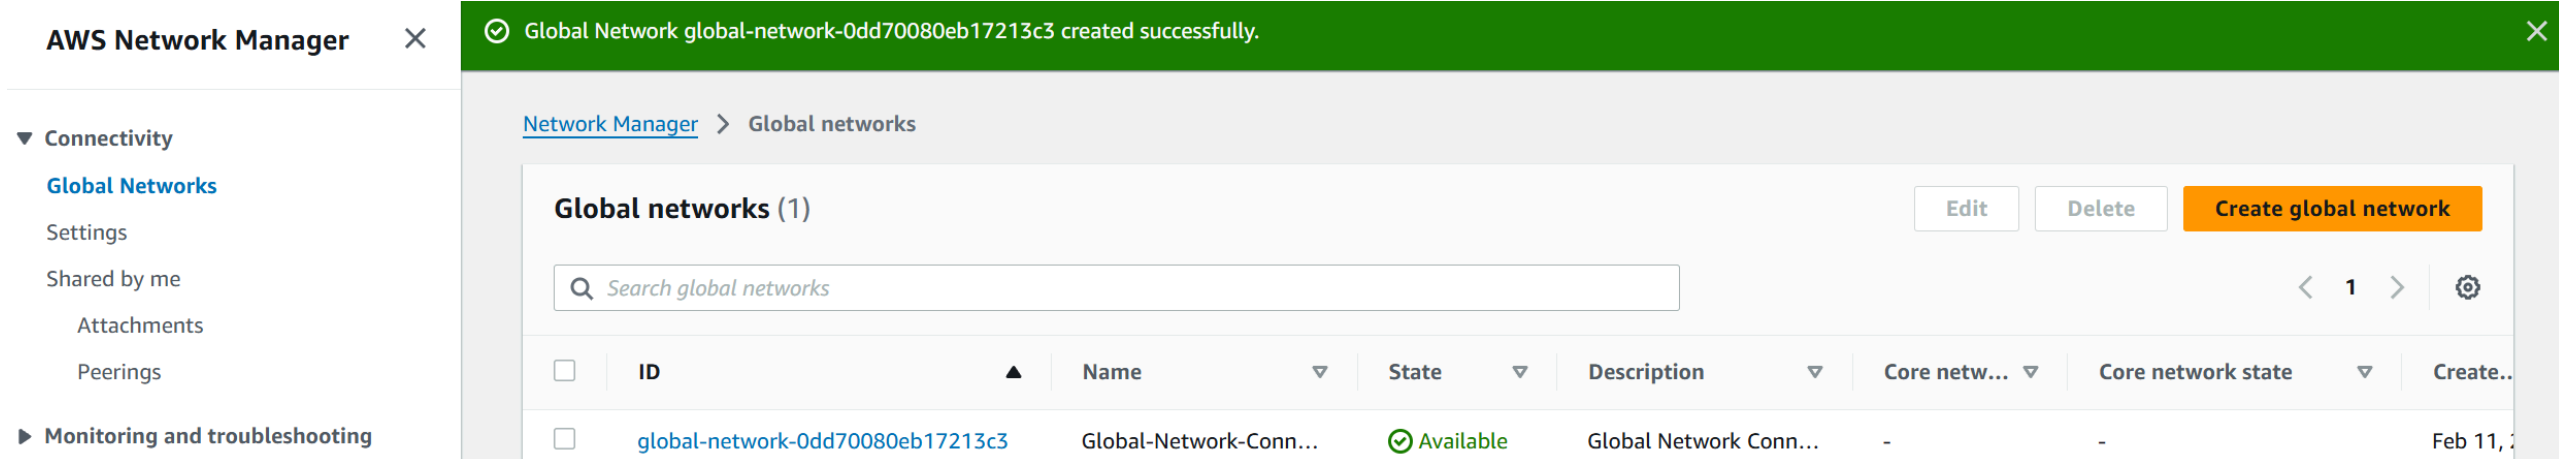

3. Uncheck the box to exclude core network and click on **Next**.

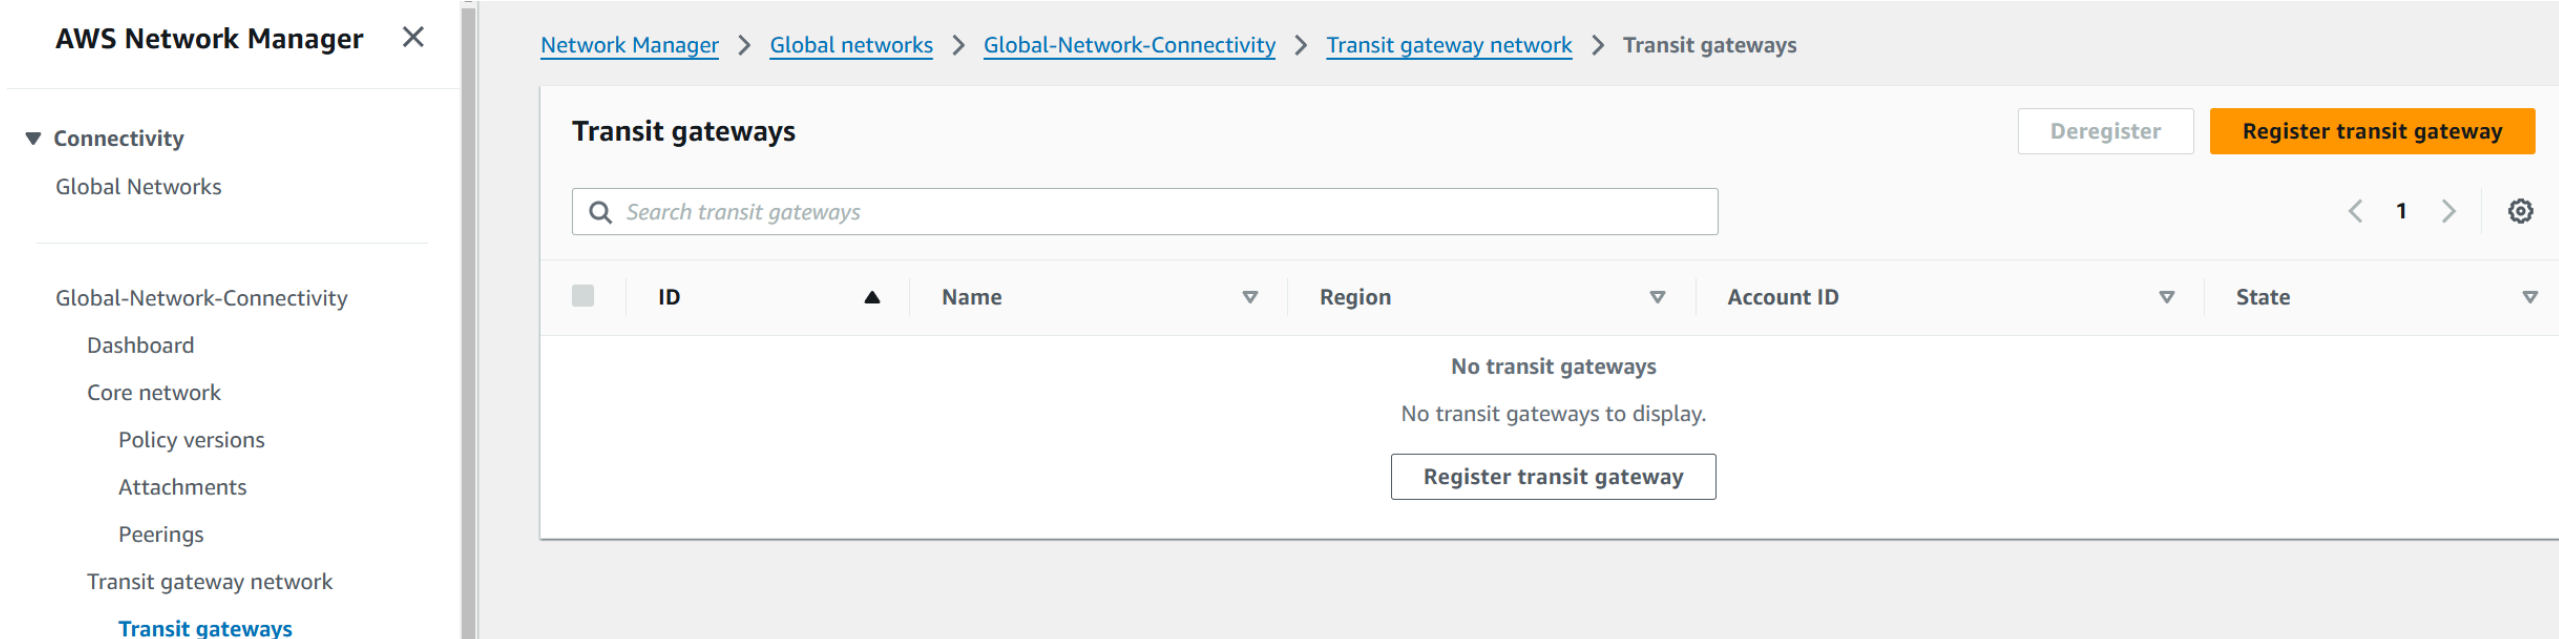

4. Review the configuration and Click on **Create Global Network**.

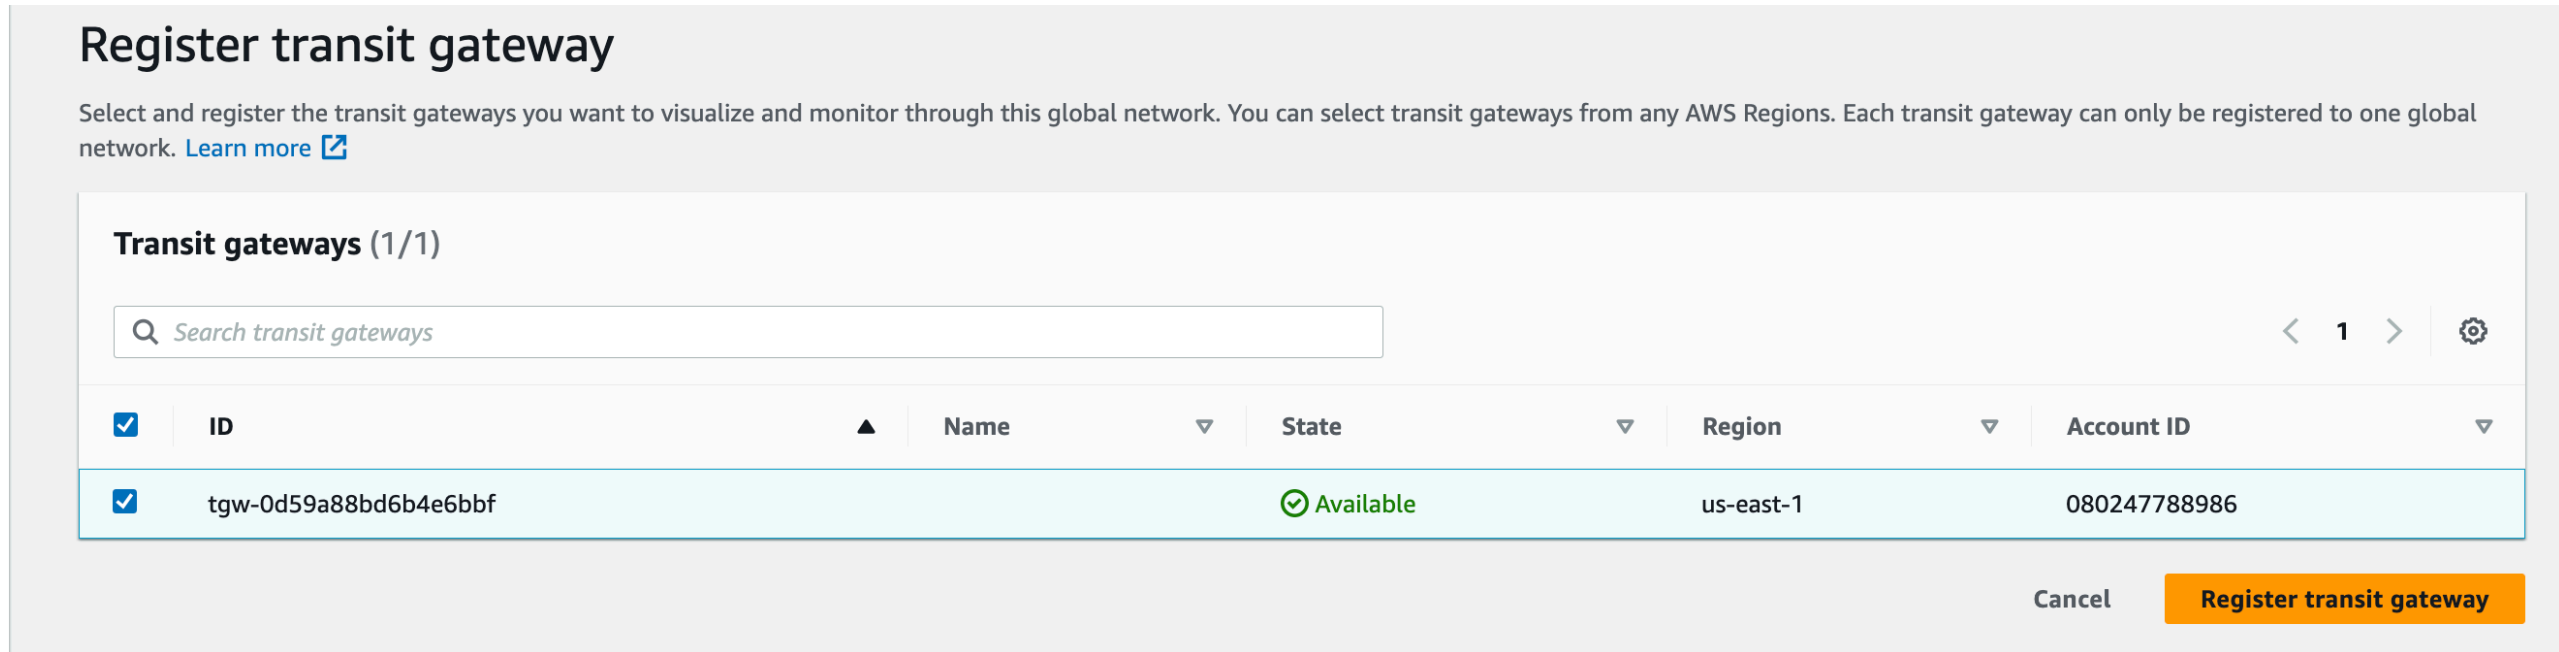

5. Your Global network would be created successfully.

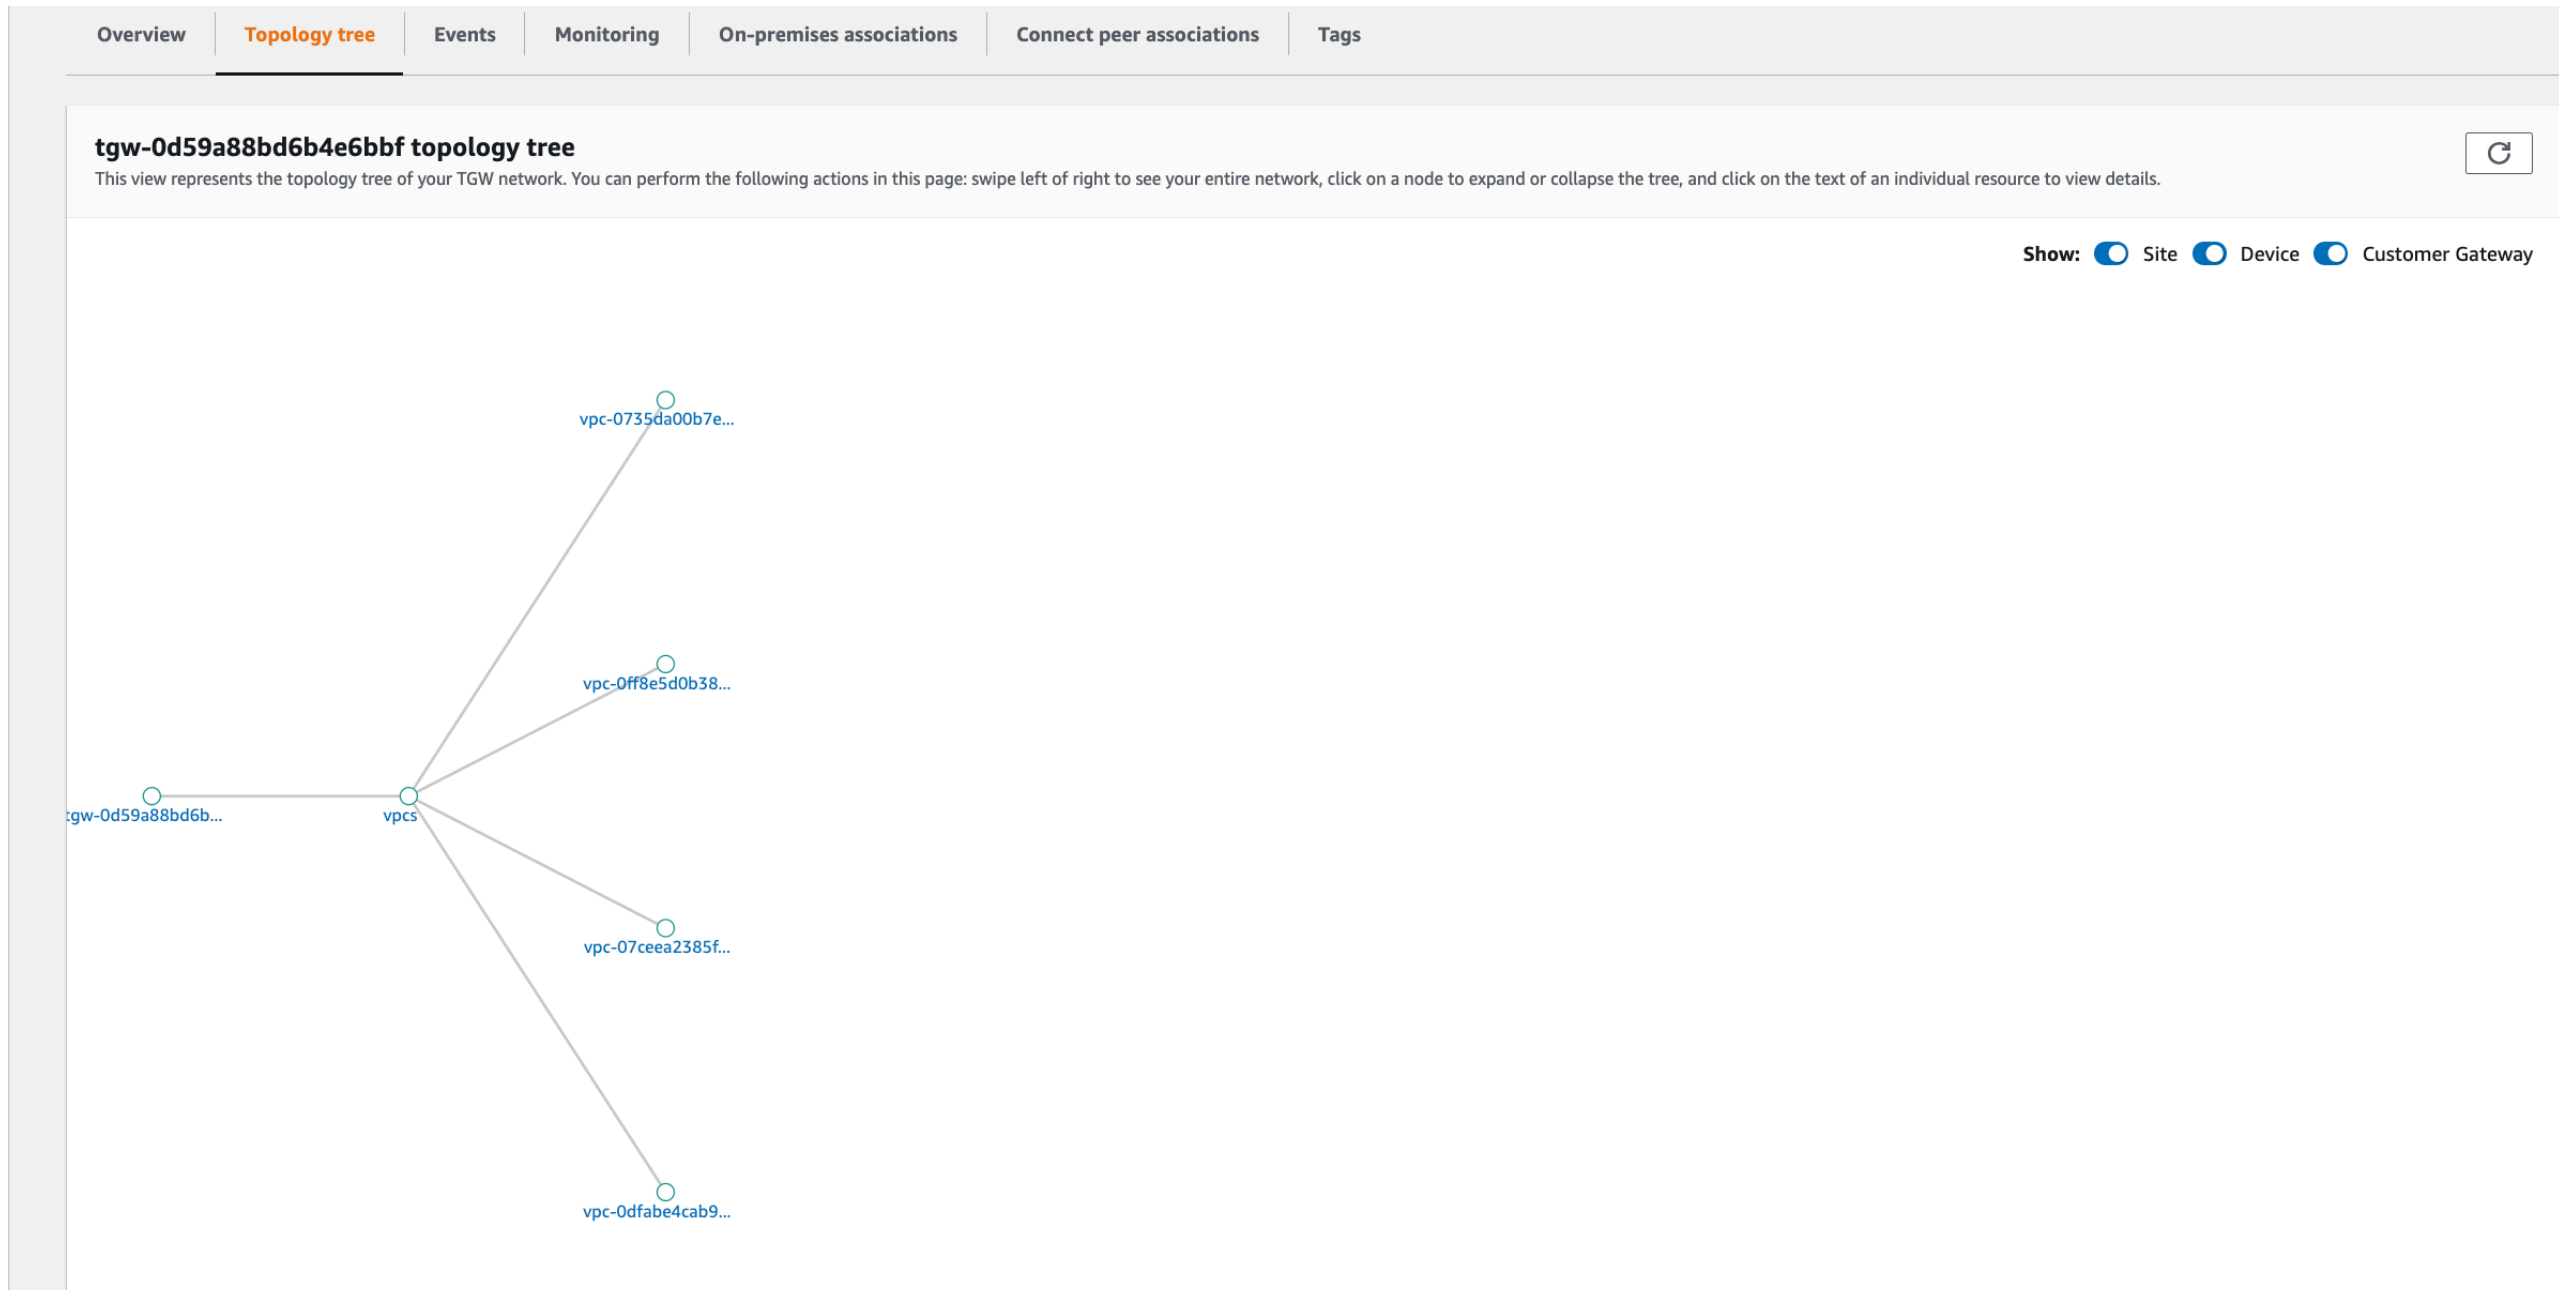

6. Now go to your Global Network and Click on **Transit Gateways** under **Transit Gateway Network**. Click on **Register transit gateway**.

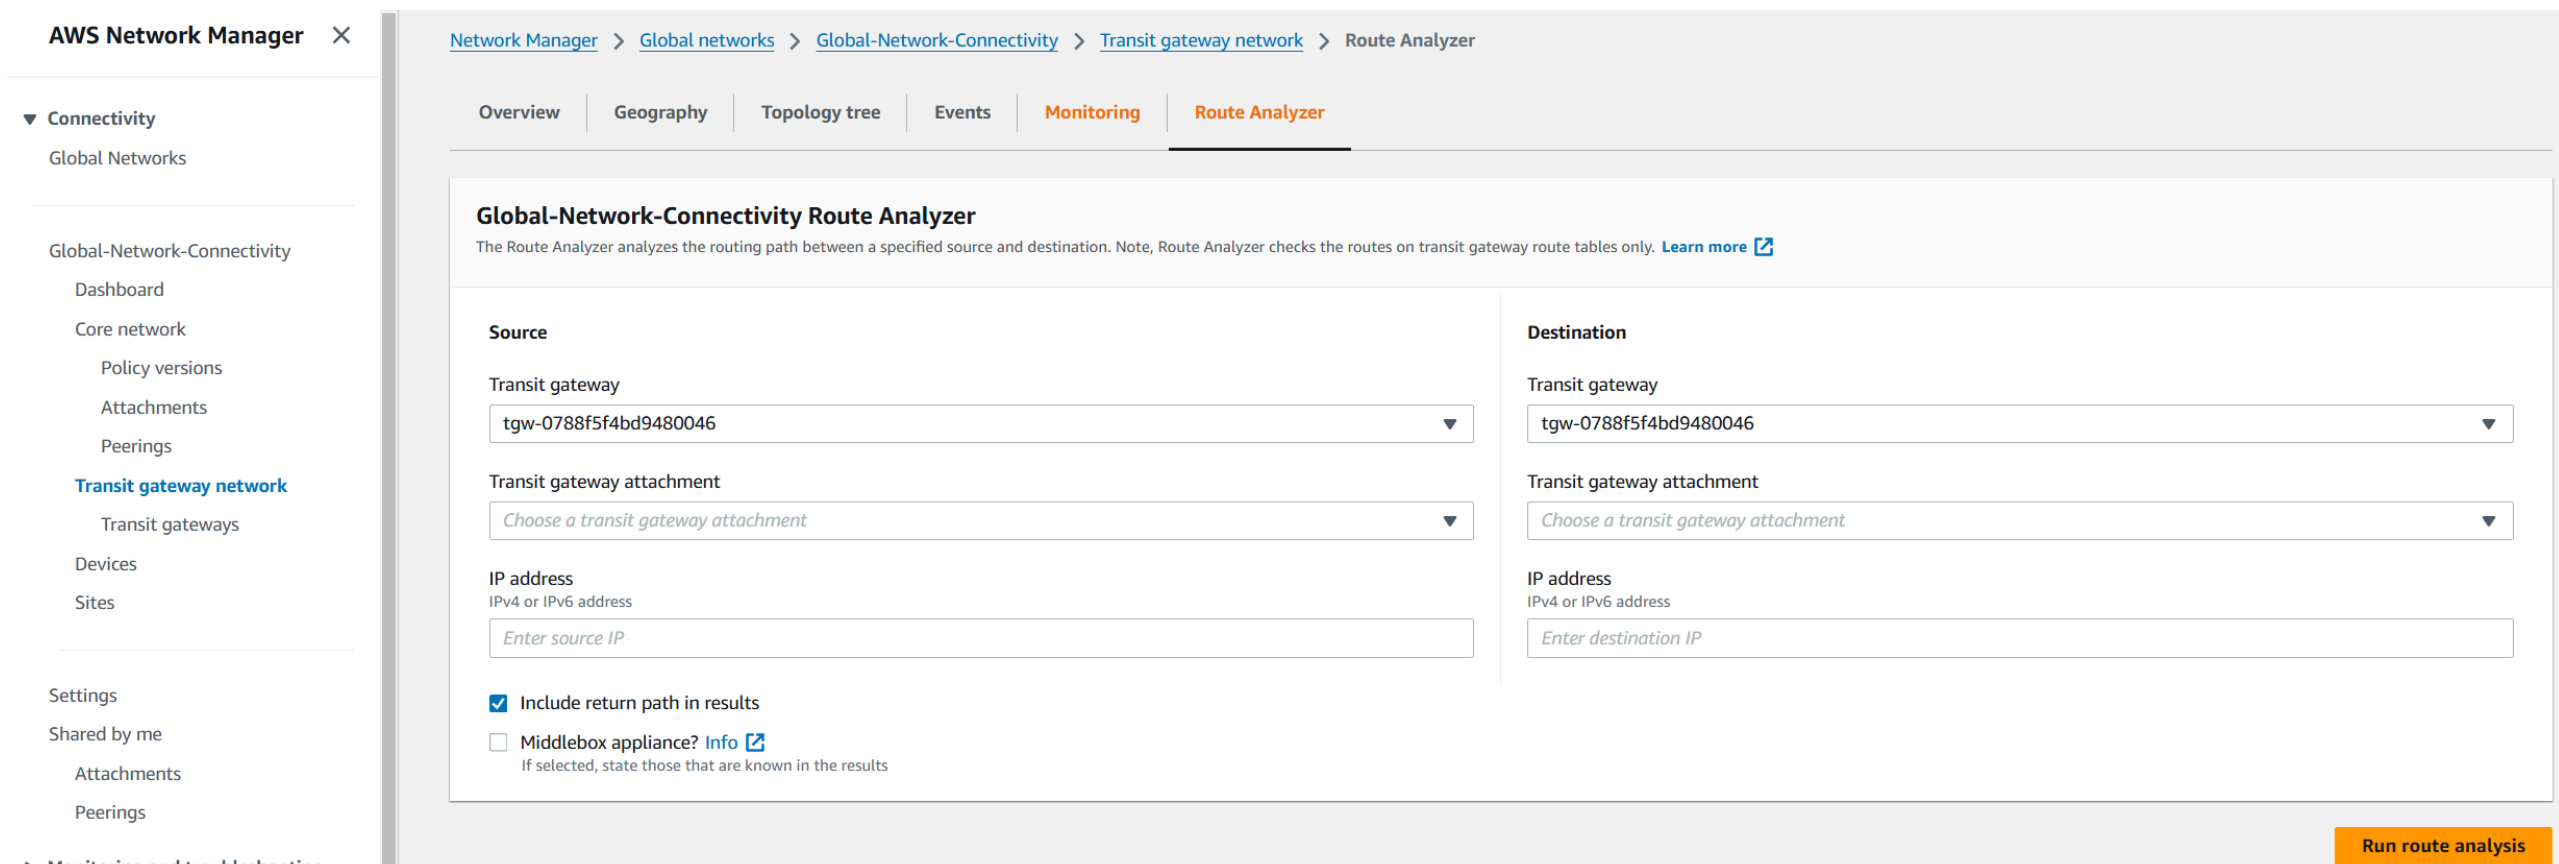

7. Select the transit gateway listed and Click on **Register transit gateway**. Post that, it goes in pending state.

8. After it gets available, click on transit gateways from the left pane and open the already registered transit gateway. You can visualize the topological view of your network. Check all the VPC attachments.

9. You can go to Transit Gateway Network and visualize your network with a different view. In the next Lab you will use **Route Analyzer** to understand how routing works on TGW.

Summary: This completes Lab 1. In this lab you created the global network and registered transit gateway. Later you used Network manager to visualize the network topology.
